

ABSTRACT

In a pressure-sensitive sensor for detecting seizure of an object in the window frame or the like, support means 13 is more flexible than a piezoelectric sensor 12, and the support means 13 is easily deformed
5 together with the piezoelectric sensor 12 without impeding the deformation of the piezoelectric sensor 12, and an output signal is issued from the piezoelectric sensor 12 depending on this deformation. Accordingly, when detecting the contact of an object with a pressure-sensitive sensor 4 by a judging device, the pressure-sensitive
10 sensor 4 for generating an output signal of a sufficient magnitude for detection can be presented.
